Allure Reporter - Adding Environment

Background:

Allure Reporter's `addEnvironment` method is deprecated. There is a new way of adding environment names to Allure Reporter

Steps:

1. In `wdio.conf.ts` file, under the \`reporters\` array, add environment values with `reportedEnvironmentVars`

Example:

```
reporters: ['spec',
['allure',
    {
        outputDir: 'allure-results',
        disableWebdriverStepsReporting: true,
        useCucumberStepReporter: true,
        reportedEnvironmentVars: {
            Environment: "TEST",
            Middleware: "SIT-EAI"
        }
    }
]
]
```

Please note, you might want to pass environment variables via `process.env` to set different environment values as the `browser` object is not available until the hooks are initiated.
